

Debt-mechanic proxies do not predict the label, they contain it

Left: ROC for predicting who holds debt, five-fold cross-validation. Right: standardised coefficients, honest model

“Honest only” is the 34-column behavioural set; “plus proxies” adds the 10 debt-mechanic columns. Faint lines are the five individual folds; the solid line is their vertical average. The quoted AUC is the MEAN of the five per-fold AUCs ± 1 SD — the quantity `validation_report.md` pins — not the area under the averaged curve. Bars to the right of zero raise the predicted probability of holding debt; the 20 omitted coefficients all sit within ± 0.16 .
