

The column set this repo calls “fair” is not fair for this label

ROC for predicting who saves, five-fold cross-validation

The month-close sweep is a debit on the current account, so money out and end balance encode the saver flag directly. Quarantining those two columns (34 → 32) is what separates the honest curve from the other two. Faint lines are the five individual folds; solid lines their vertical average. Quoted AUCs are the mean of the five per-fold values ± 1 SD, the estimator validation_report.md pins.
